SOVIET SRF PROBABLE REGIONAL HEADQUARTERS FACILITIES (SUPPLEMENT)

INTRODUCTION

This report supplements the previously reported information on 9 Soviet Strategic Rocket Forces (SRF) Probable Regional Headquarters Facilities, 1/and consists of 3 sections, each of which is in response to a referenced requirement. The first section describes the Pruzhany SRF Probable Regional Headquarters Facility and the Postavy SRF Probable Regional Headquarters Facility, neither of which was described in detail in the previous report.* This section also includes a tabular description of the antennas within the facilities (Table 1). The second section is a detailed graphic description of the support areas associated with the SRF regional facilities and includes a tabular summary of the number and types of buildings within each facility (Table 2). The final section includes the orientations and correspondents of the hardened (subsurface) communications antennas identified at all of the SRF probable regional headquarters facilities and a tabular summary of the orientations and correspondents of the antennas (Table 3).

SECTION 1

Pruzhany SRF Probable Regional Headquarters Facility

The Pruzhany SRF Probable Regional Headquarters Facility is at 52-35N 24-32E, 3.5 nm northeast of Pruzhany, USSR (Figure 1). It consists of 2 separate areas, a communications area at the above coordinates and a command bunker area 2 nm southwest of the communications area.

The facility was not present on Mission and was first observed

The communi-Communications Area. cations area (Figure 2) is in heavy woods which probably conceal it from ground obser-It contains a bunkered arch-roofed control building, a hardened (subsurface) com-

munications antenna, and several above ground high-frequency (HF) antennas. The HF antennas include 1 pair of day-night rhombics, 1 large vee, and 2 horizontal dipoles. The antenna orientations show that the pair of rhombic antennas and the hardened (subsurface) antenna correspond with Moskva, whereas the dipoles are oriented to correspond with Smolensk (Table 1).

Command Bunker Area. The triple-sectioned command bunker (Figure 3) is identical to those at the previously reported and described SRF regional facilities 1/ and is an addition to an older facility of unidentified purpose. Adjacent to the command bunker are 2 horizontal dipole antennas which are oriented to correspond with Moskva.

Support is apparently shared with the unidentified facility collocated with the command bunker.

Postavy SRF Probable Regional Headquarters Facility

The Postavy SRF Probable Regional Head-quarters Facility is at 55-05N 026-51E, 1 nm south-southeast of Postavy, USSR (Figure 1). Like Pruzhany, it consists of 2 separate areas, one containing communications antennas and the other a triple-sectioned command bunker. This facility was not present on photography and was first

Communications Area. The communications area (Figure 4) contains a bunkered, arch-

roofed control building; 2 hardened (subsurface) communications antennas; approximately 4 horizontal dipole antennas which are oriented in 2 directions; and 1 vee antenna. One hardened (subsurface) antenna and a set of dipole antennas correspond with Moskva; the other hardened (subsurface) antenna and set of dipole antennas are oriented to correspond with Smolensk (Table 1).

Command Bunker Area. The triple-sectioned command bunker (Figure 5) is situated at the Postavy Army Barracks East. It is identical to that found at the other regional facilities. Support is apparently furnished from the barracks area. No antennas were identified in the immediate vicinity of the command bunker.

SECTION 2

SRF Probable Regional Facilities Support

Photo analysis reveals that the support areas serving the SRF regional facilities are strikingly similar in those cases where the regional facilities are isolated, i.e., not collocated with a barracks area, etc. This section presents a graphic description, with dimensions, of the types of support buildings which occur at these facilities (Figure 6) and a tabular accounting of the buildings within each facility support area (Table 2).

SECTION 3

Hardened (Subsurface) Communications Antennas

The hardened (subsurface) communications antennas identified at the SRF regional facilities, 1/ as well as at numerous Soviet strategic missile site communications facilities, have been carefully oriented to correspond with higher echelons of SRF command.

This determination is based on comparisons of the positions of the hardened (subsurface) antennas with the positions of known directive antennas within the same facility such as the horizontal dipole and rhombic antennas. These comparisons reveal that the hardened antennas are in fact aligned with certain of these other directive antennas and that signal propagation is in a direction perpendicular to the long axis of the antenna.

A consideration of the distances involved between correspondents reveals the hardened

^{*}Propagation direction is perpendicular to the long axis of the antenna.

(subsurface) antennas to have a much greater range than was originally thought. Their range is now determined to be at least 800 nm and there is the probability that it may be greater.

Orientations and correspondents of the hardened antennas at individual facilities are given in Table 3. It is noted that the correspondents in all cases are the Moskva, Smolensk, or Vinnitsa areas.
